Sample Practice Question and Analysis

Question:

A 45-year-old patient presents with generalized bleeding gums, loose teeth, and a history of poor oral hygiene. Radiographs show alveolar bone loss. Which of the following is the most likely

diagnosis?

- A) Chronic gingivitis
- B) Periodontal disease
- C) Dental caries
- D) Dental abscess

Correct Answer: B) Periodontal disease

Analysis:

This scenario describes clinical signs characteristic of periodontal disease, including bleeding gums, mobility of teeth, alveolar bone loss, and poor oral hygiene. The other options are less consistent: chronic gingivitis involves inflammation but not bone loss; caries affects tooth structure; abscess is localized and involves infection but not generalized bone loss.
